Code Explanation (Resume Analyzer & Improver)

Imports

```
import streamlit as st
import PyPDF2
```

- streamlit → Used to create a web app interface easily.
- PyPDF2 → Used to read text from PDF files (like your resume).

Extract Text from PDF

```
def extract_text_from_pdf(pdf_file):
    reader = PyPDF2.PdfReader(pdf_file)
    text = ""
    for page in reader.pages:
        if page.extract_text():
            text += page.extract_text()
    return text
```

- Opens the PDF file.
- Reads text page by page.
- Combines all text into a single string.
- Returns the text for analysis.

Calculate Resume Score

```
def calculate_score(text):
    score = 0
    text = text.lower()
    keywords = ["education", "skills", "project", "internship", "experience"]
    for word in keywords:
        if word in text:
            score += 20
    if len(text) > 1000:
        score += 10
    return min(score, 100)
```

- Looks for important resume keywords.
- Adds points if keywords are present.
- Adds extra points if resume is long enough.
- Caps score at 100.

Suggestions

```
def suggest_improvements(text):
    suggestions = []
    text = text.lower()
    if "objective" not in text:
        suggestions.append("Add career objective section")
    if "project" not in text:
        suggestions.append("Add at least one project")
    if "skills" not in text:
        suggestions.append("Mention technical skills clearly")
    if len(text) < 800:
        suggestions.append("Resume content is too short")
    return suggestions
```

- Checks for missing sections in the resume.
- Returns a list of suggestions to improve it.

Rewrite Bullet Points

```
def rewrite_bullets(text):
    lines = text.split("\n")
    improved = []
    for line in lines:
        if len(line.strip()) > 20:
            improved.append("✓ Successfully worked on: " + line.strip())
    return improved[:5]
```

- Takes each line from the resume.
- If line is long enough, converts it into a “strong” bullet point.
- Returns first 5 improved points.

Streamlit Interface

```
st.title("Resume Analyzer & Improver")

uploaded_file = st.file_uploader("Upload your Resume (PDF)", type=["pdf"])

if uploaded_file is not None:
    text = extract_text_from_pdf(uploaded_file)

    st.subheader("Resume Score")
    score = calculate_score(text)
    st.write(score, "/ 100")

    st.subheader("Suggestions")
    suggestions = suggest_improvements(text)
    if suggestions:
```

```
    for s in suggestions:
        st.write("•", s)
else:
    st.write("Your resume looks good!")

st.subheader("Improved Bullet Points")
bullets = rewrite_bullets(text)
for b in bullets:
    st.write(b)
```

- Displays a title and file uploader in a browser.
- Once a PDF is uploaded:
    1. Extracts text.
    2. Shows a score.
    3. Gives suggestions.
    4. Shows improved bullet points.

2⃣ Commands You Mentioned

a) Navigate to the folder

cd OneDrive\Desktop\GEN_AI_4H4\Resume.py

- **cd** → "change directory".
- You're trying to go to the folder where your Python file is located.
  ⚠️ **Correction:** Resume.py is a file, not a folder. You should go to the folder:

cd OneDrive\Desktop\GEN_AI_4H4

---

b) Run Streamlit app

python -m streamlit run resumecode.py

- Tells Python to run **Streamlit**.
- resumecode.py → Your script filename.
- This opens a web page in your browser with the resume analyzer.

---

c) Running again

python -m streamlit run resumecode.py

- Same as above. Running twice is not needed unless you made changes.

✅ **In short**:

1. Go to folder → cd ...
2. Run Streamlit once → python -m streamlit run resumecode.py
3. Open browser → upload resume → see score, suggestions, and bullet improvements.
